- » Monitors online systems from all major vendors
- » Approved and in use for MUSL auditing
- » Approved and in use for Euro-Millions Rapid Audit
- » Developed independent of any online lottery system

## INTEGRITY REAL-TIME ICS

### Proactive in its vigilance and aggressive in its protection

**Integrity** is a Windows 2003 server-based solution that can operate either as a single companion system to an online or internet gaming operation, or as a network of such companion systems to multiple gaming sites with a central Controller system. The Controller system consolidates summary information from each of the gaming sites, allowing a single operator to monitor multiple gaming sites, or to allow a central regulatory agency to view synoptic information relating to operators within their jurisdiction.

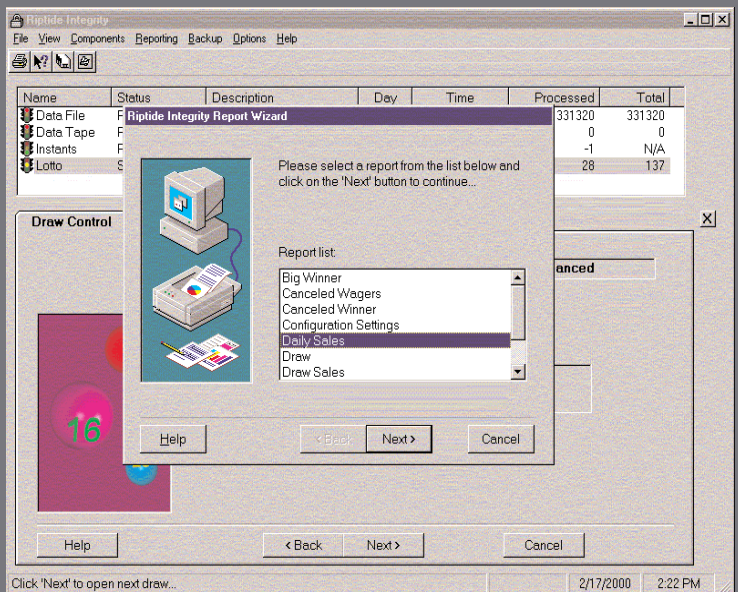

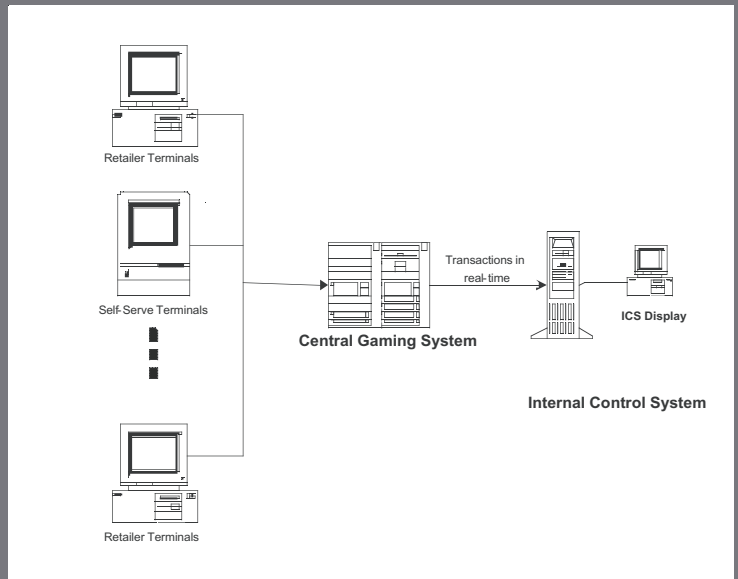

**Integrity** is easy to integrate with the internet or online system. We provide an Application Program Interface (API) for a concurrent transaction feed from the mainline system. **Integrity** can function either in real-time mode where transactions are transmitted to the ICS as they arrive, or in batch mode, where transactions are read from an existing log file.

## INTEGRITY HELPS MANAGE YOUR BUSINESS

While **Integrity** is performing its audit of the transaction feed, it is also compiling information about your business in real time and allows you to interrogate that information, at any time, to make business decisions. You can get a snapshot of your current financial status, or a picture of sales trends for the day. While **Integrity** looks out for problems in your online system—it also gives you powerful information to manage your business!
